

Legend

- Moderate Pondweed
- Trace Pondweed

Survey Notes

Trace to moderate (density) patches of snail-seed pondweed (*Potamogeton bicupulatus*), a thin-leaf pondweed, were found scattered throughout the littoral zone. A trace and infrequent amount of bladderwort (*Utricularia sp.*) was also observed, though negligible. The change in vegetation composition between the pre-management and post-management surveys is most likely due to seasonality.
